

**CryoLand Dissemination Workshop – Nordic, Oslo 2014-10-08**

# Snow melt and Flood warning at SMHI

## - use of satellite snow data

**Judith Olofsson, Gustav Carlsson, David Gustafsson**

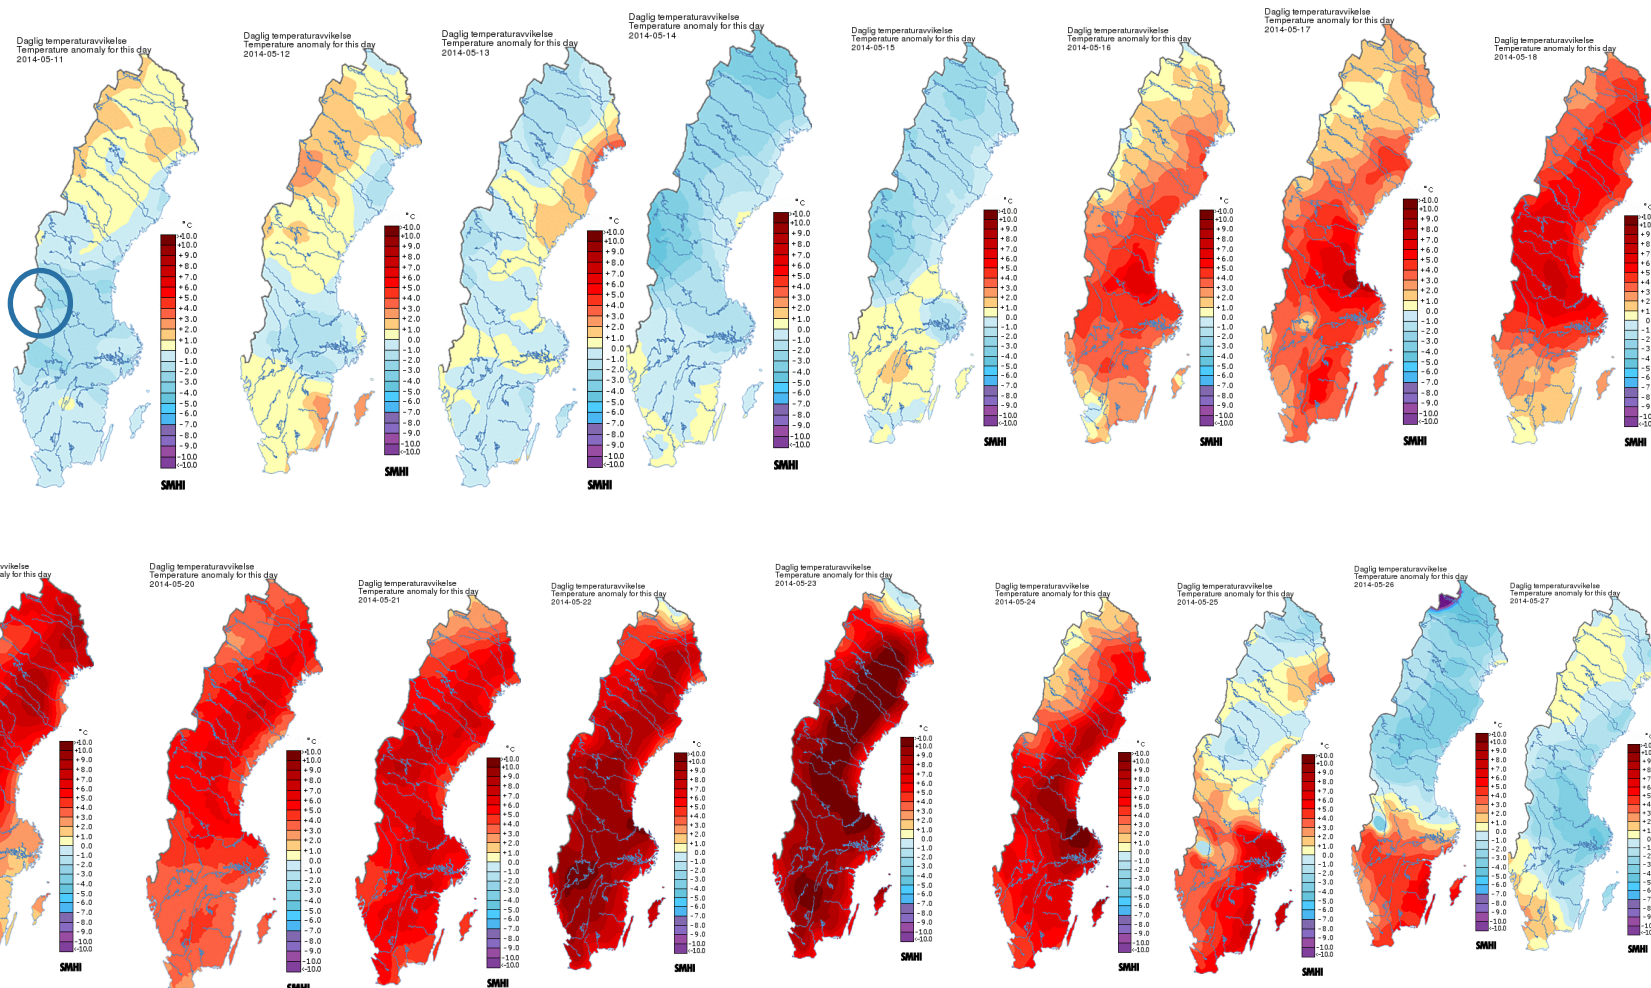

## **SMHI CryoLand User activities**

- **Research and development** (David Gustafsson) – project partner
  - Assimilation of CryoLand Satellite Snow data in hydrological models
  - Tools for download, pre-processing, evaluation
  - Support to Swedish users
  
- **Flood warning** (Judith Olofsson, Gustav Carlsson)
  - Evaluation of simulated snow condition in high flow situations:
    - ”Is the snow conditions in the model correct for the forecast?”
  
- **Ice break up Tornionjoki** (David and Judith)
  - Attempt to monitor river ice break-up in Tornionjoki, in collaboration with SYKE, NORUT and ENVEO.

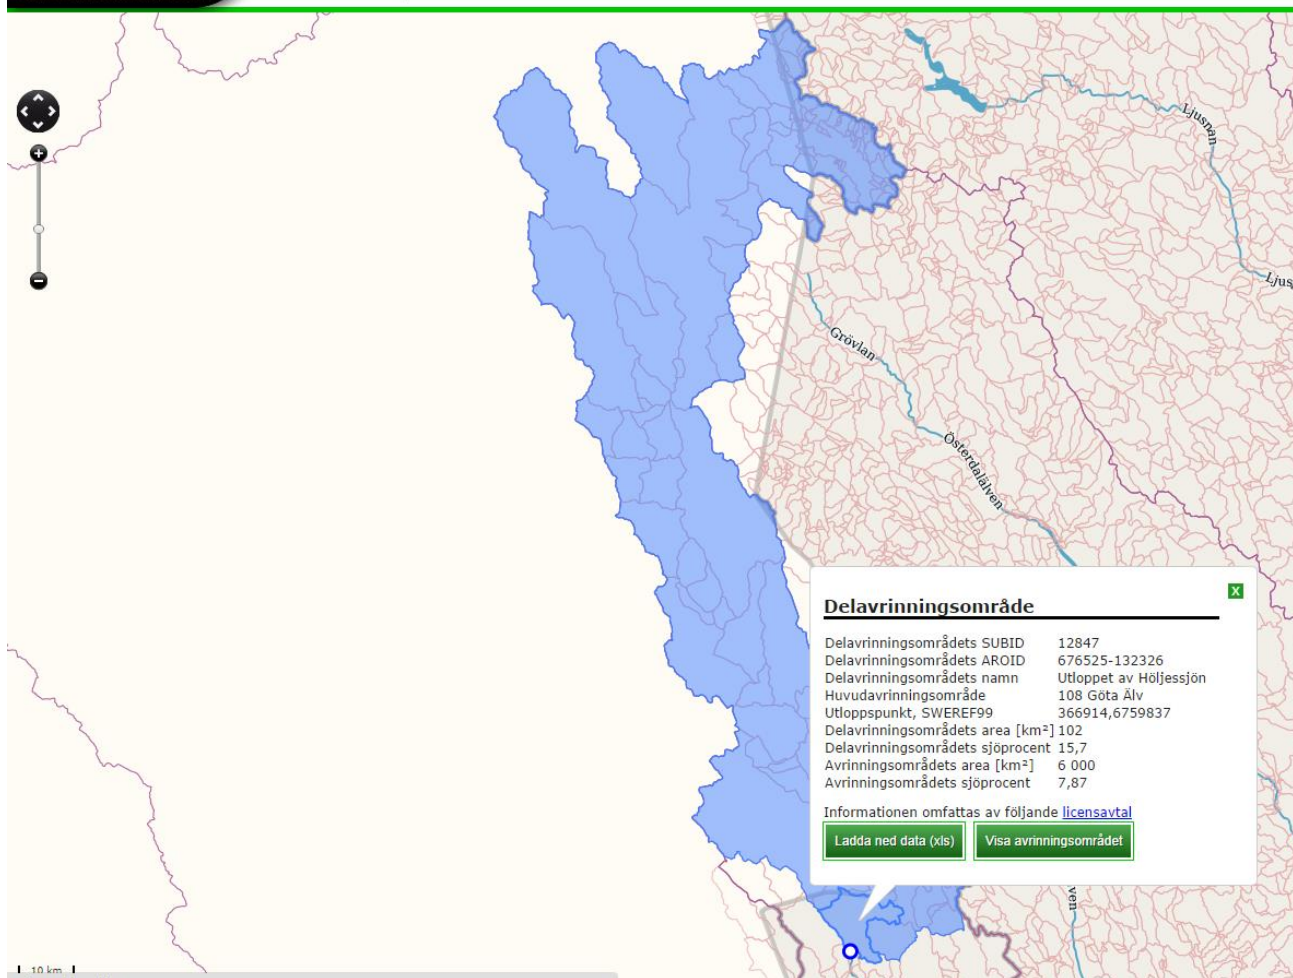

# May 11 to May 27. The forecast says 12 days with temperatures about +5°C above normal in south west of Sweden.

Höljes

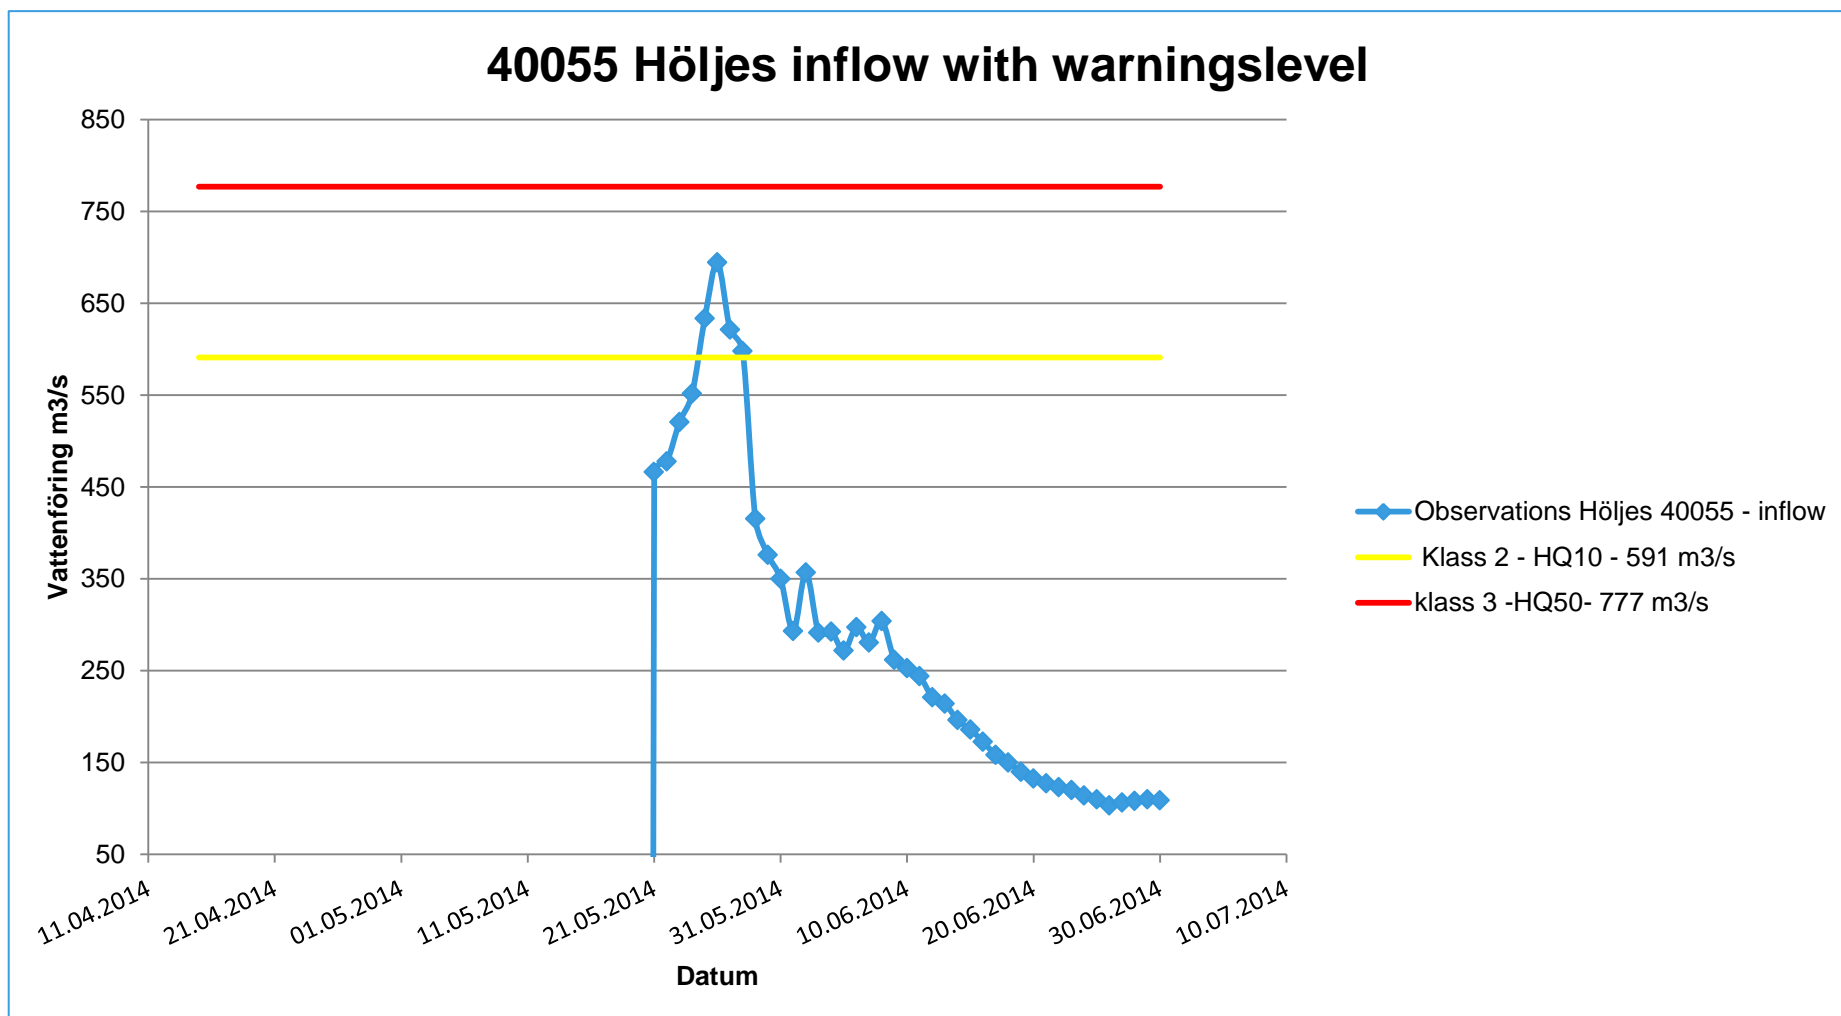

# Höljes basin on border between Norway and Sweden

SMHI Vattenwebb Modelldata per område

## Actual flow – warning level 2

Klass2-warnings 26/5 Klarälven downstream the reservoir of Höljes  
27-29/5 upper part of Klarälven down to Edebäck

Observed inflow, m<sup>3</sup>/s

25/5 - 633.5 ----- misses to warn here

26/5 - 694.4

27/5 - 621.4

28/5 - 597.8

29/5 - 415.5 ----- warning but inflow below warningslevel

Observed outflow

Above warninglevel klass2 for 26/5, 27/5, 28/5

# Simulation with real observations (not forecast)

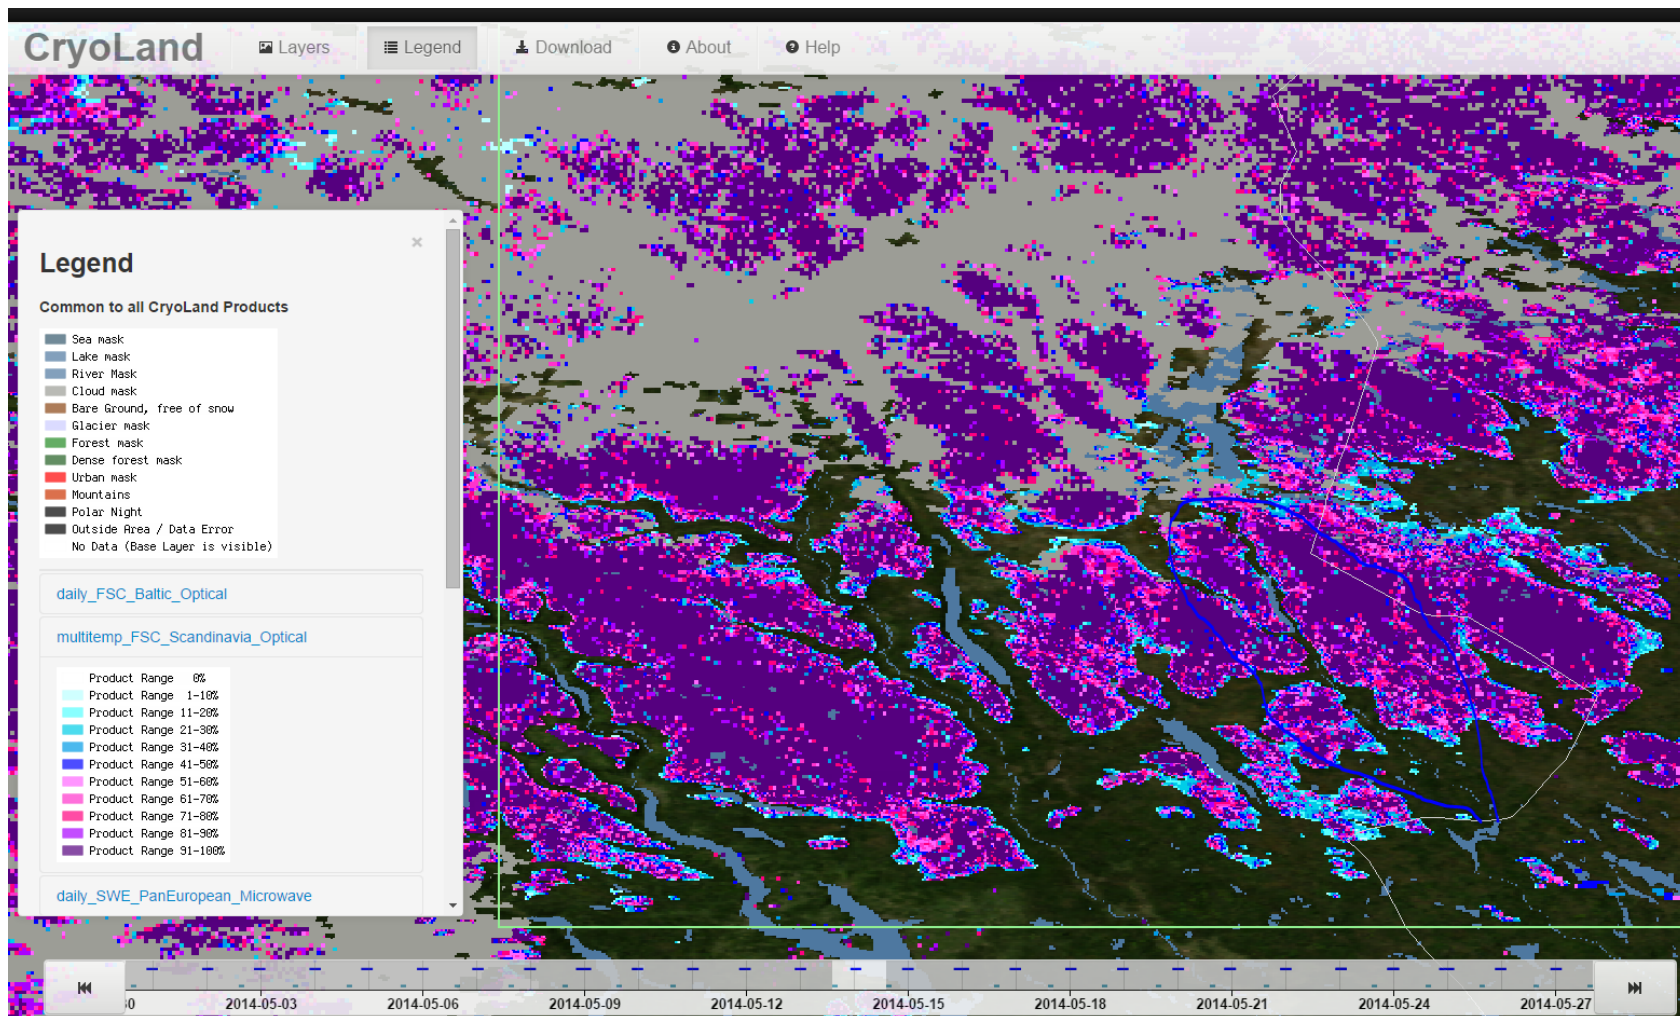

## **Questions at forecast time**

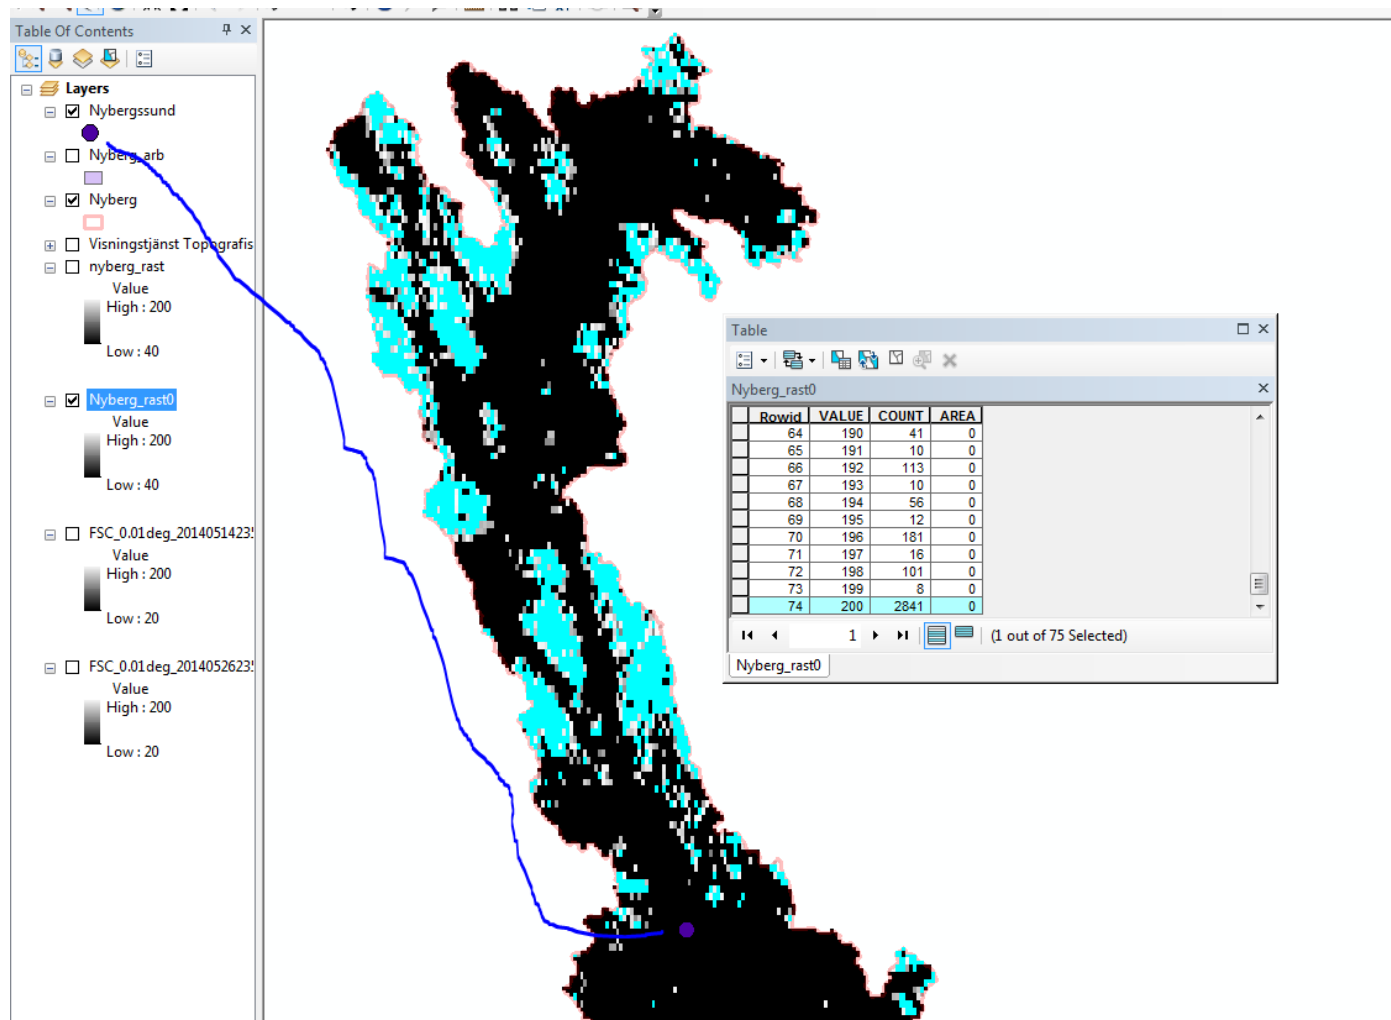

- Is the amount of snow in the model correct?
- Can we estimate the amount of snow from CryoLand data
- Visual comparison based on maps?
- Comparison of pre-processed time series?

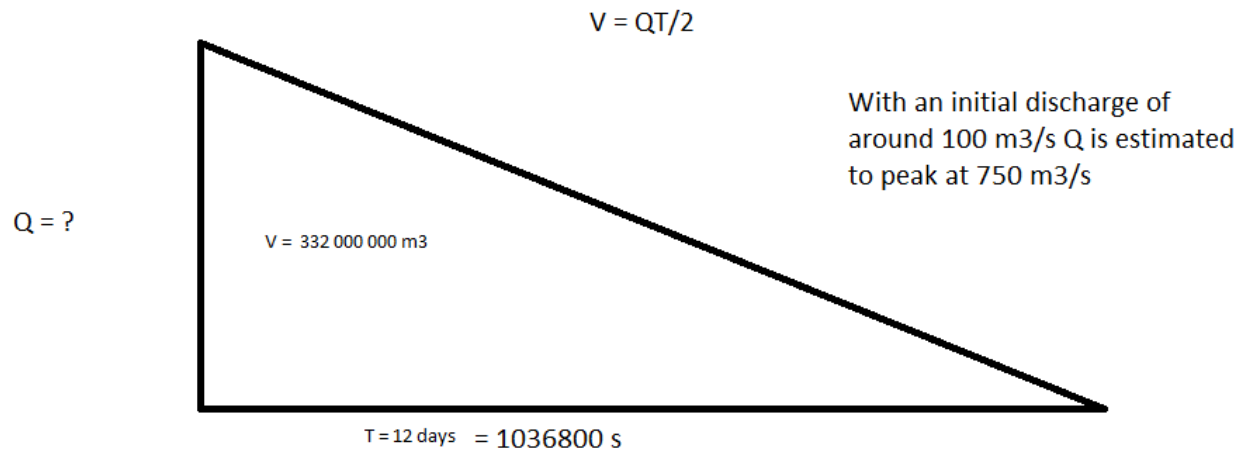

# ”Real-time” use (Gustav Carlsson)

**I select pixels with a high snow cover and I calculate an area 1022 km<sup>2</sup>. The measured snow depth around 0,3 m.**

**An area of 1022 km<sup>2</sup> and a snow depth of 0,3 m makes a volume of 332 million m<sup>3</sup> of saturated (estimated) snow to be melted during 12 days starting on the 14th of May. A calculation :**

**The reality at Nybergssund was  $\sim 700$  m<sup>3</sup>/s:**

# Post-analysis using time series of CryoLand SWE and FSC data (Judith Olofsson)

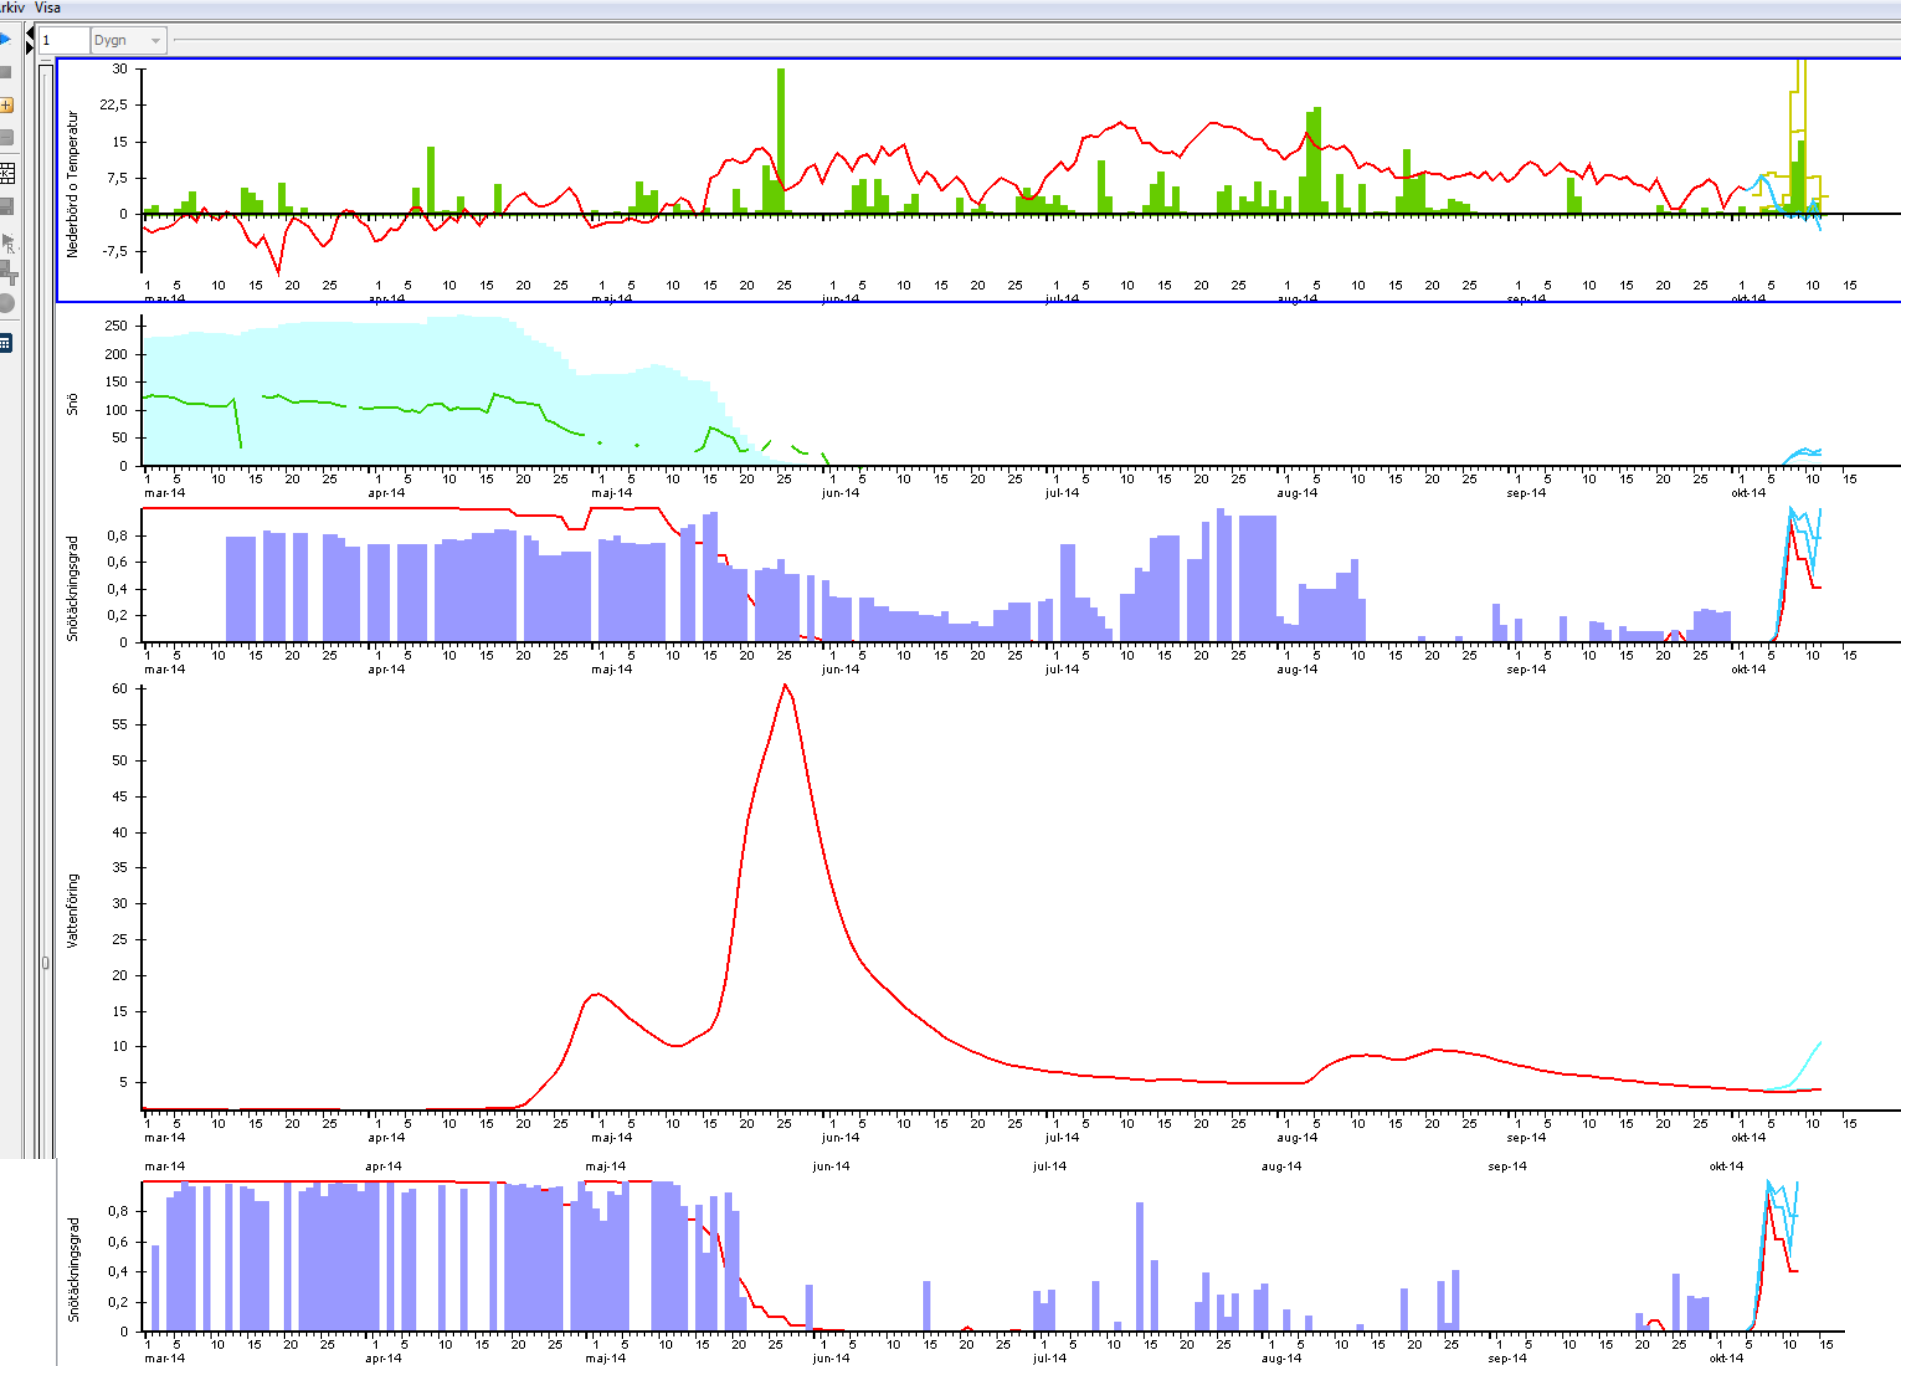

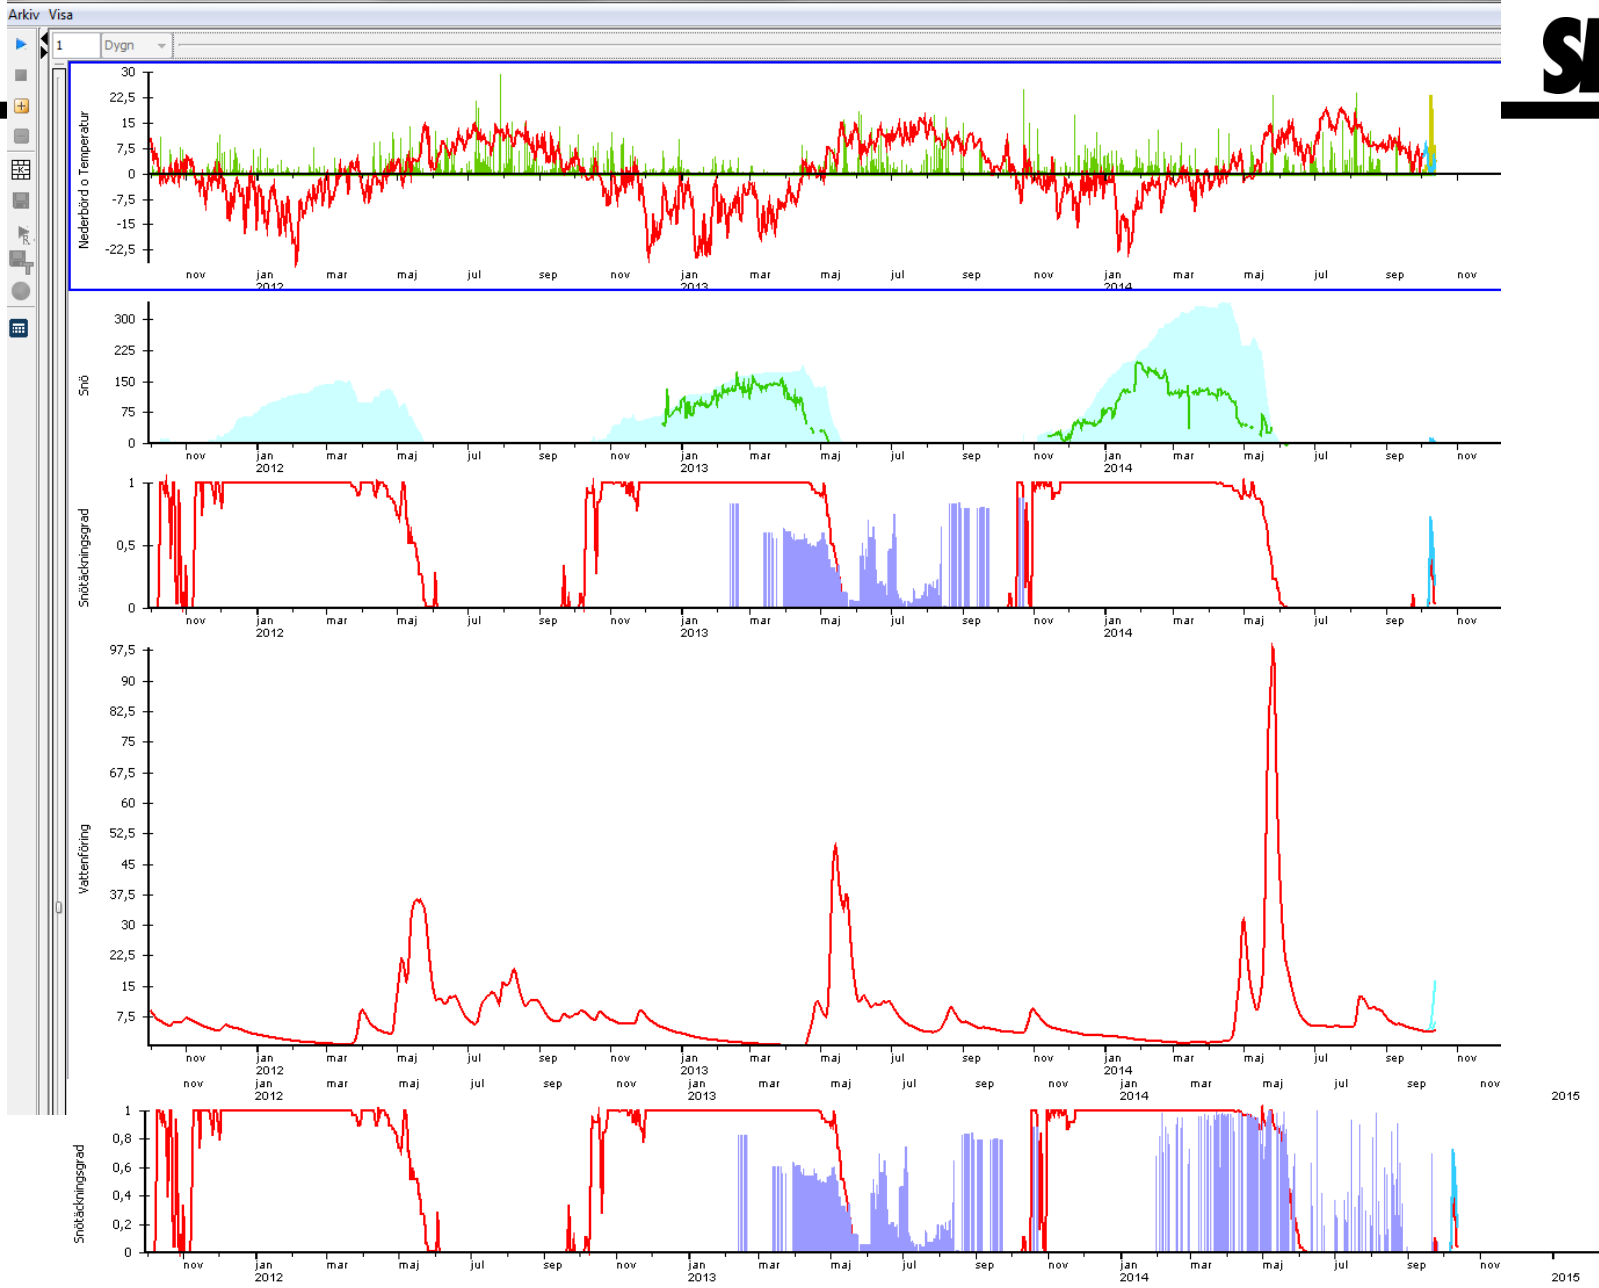

# Some attempts to take snow distribution into account

## **Final remarks**

- Evaluation of CryoLand data in SMHI flood warning on-going and will continue 2014-2015
  
- Fractional snow cover
  - good correlation and added information for snow melt dynamics
  
- SWE
  - Maximum level "saturates" (known issue)
  - Temporal variation agrees well with simulations!
  - Taking snow distribution into account might be useful
  
- Outlook: overall increased use of EO data in hydrology at SMHI
