How reindeer herding could utilize snow and ice data?

POROT project

Producing GIS data of reindeer herding to the use of, e.g. regional planning, reindeer herders, forestry and research.

Data is maintained and distributed through Internet by applications "Harava" (maintenance of the data) and "Liiteri" (viewing and downloading the data).

Co-operation with CryoLand project.

Finnish Environment Institute: Kari Oinonen (*project manager*), Petri Shemeikka, Panu Kontio

Reindeer & snow and ice

"Variation in local weather and snow conditions, especially in early winter and spring, as well as snow accumulation during winter, could have a strong impact on the reindeer population"

Kumpula & Colpaert, 2003. Polar Research 22 (2), 232.

Lichens are the main food in winter

+
supplementary feeding

The snow conditions impact on nutrition and...

- body mass
- mortality
- reproductive rate
- calf percentage

FGFRI / Photo gallery

Snow- and ice-covered areas
(date, location)

The depth of the snow

The structure of the snow
(hardness, density)

**6 to 8 months of snow cover
in reindeer herding area**

How reindeer herders and researchers could utilize the current snow and ice data?

To find out the date and location of the first and last snow-covered areas

Possibility to do field work in areas where snow and ice is needed

To monitor snow conditions during the winter

To assess the hardness of the winter

To make decisions about supplementary feeding

To get knowledge about the habitat selection in winter (GPS & snow data)

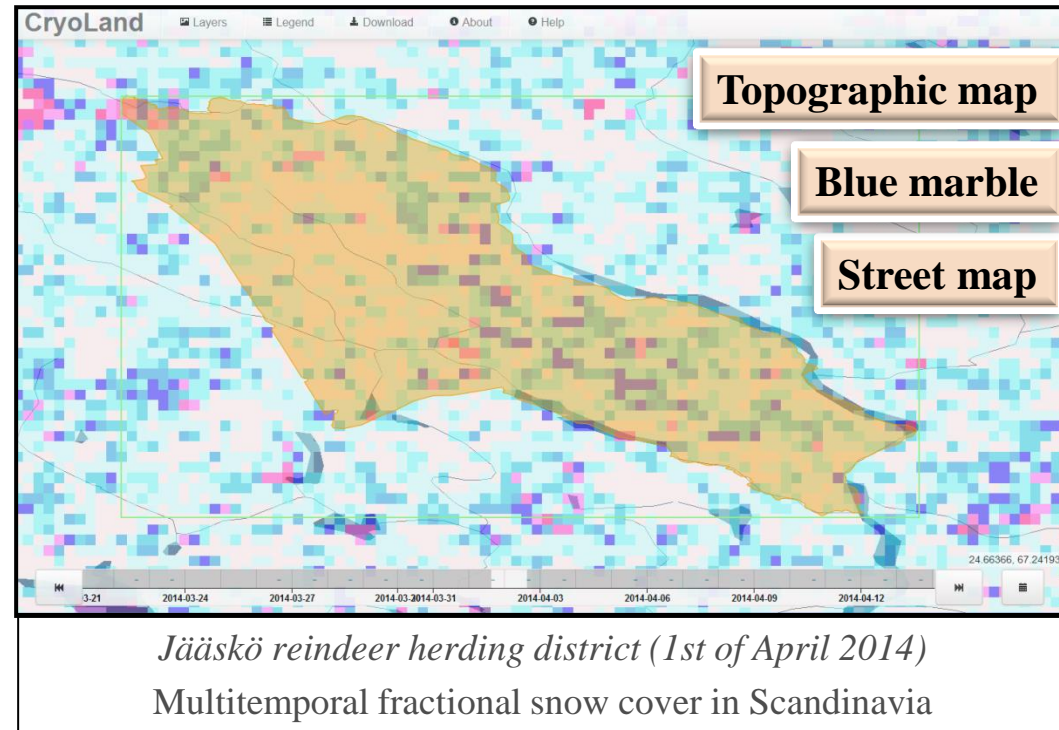

How snow and ice data could be improved to suit the needs of reindeer herding?

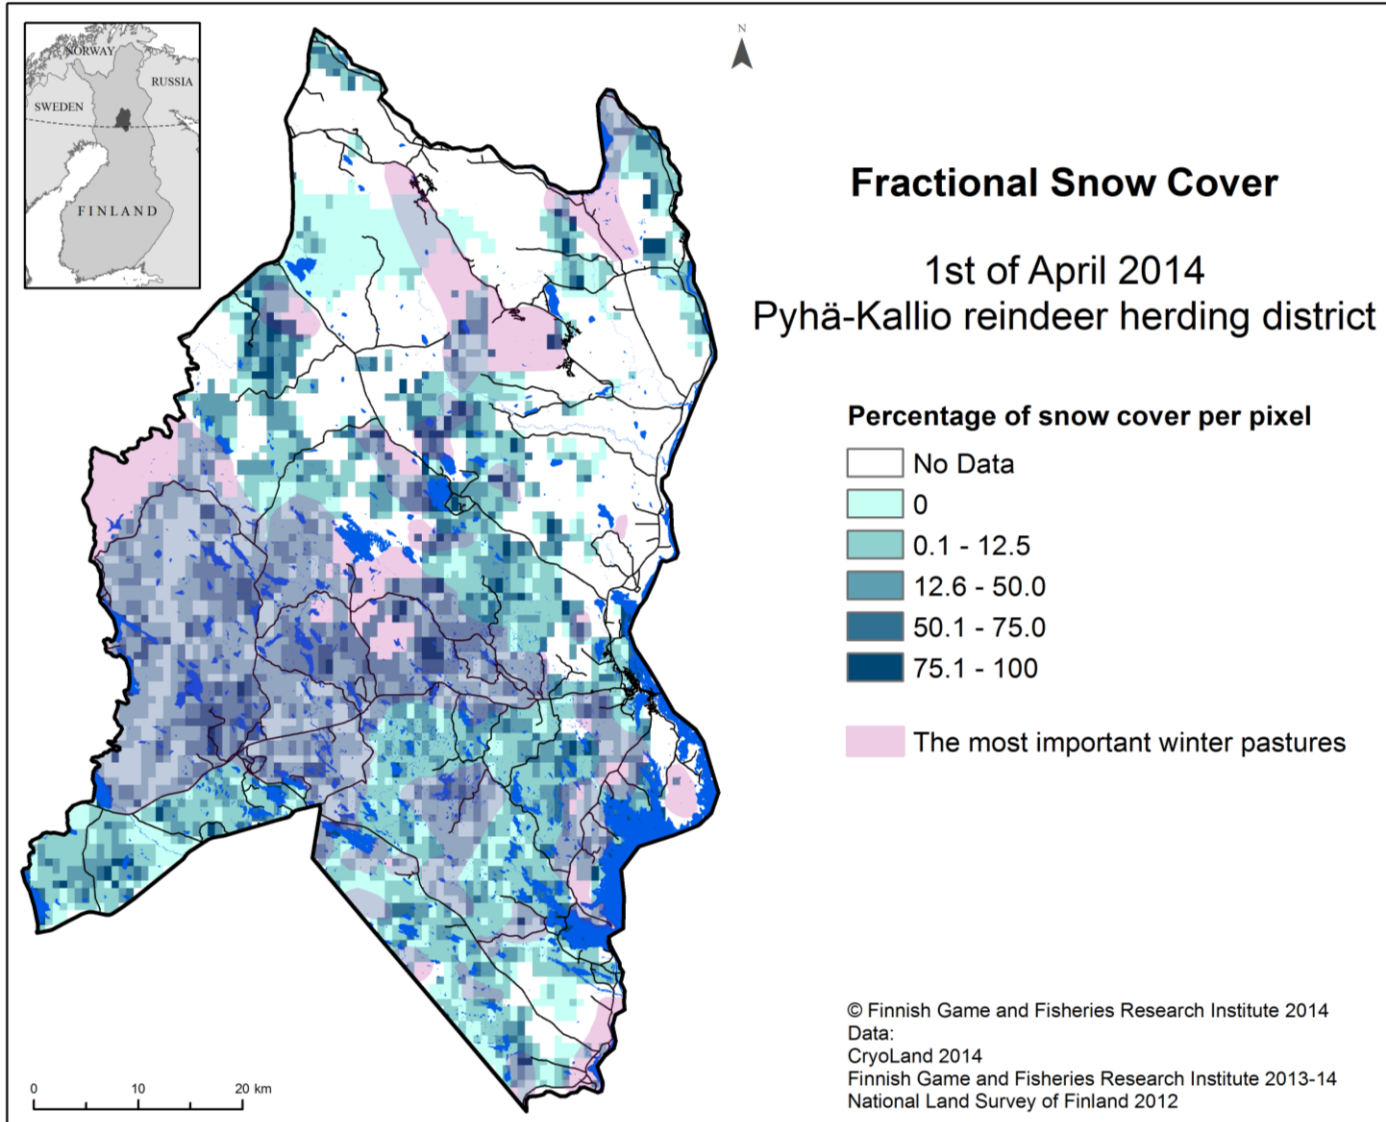

- New products
 - Lake ice in early winter
 - Snow depth (*m*) and structure (hardness, density)
 - Long-term data
 - Monthly, yearly
 - Averages, medians
- Data quality - product uncertainty?

How snow and ice data could be improved to suit the needs of reindeer herding?

- GeoPortal
 - Log in -system
 - Own zoom level (as reindeer herders are mainly interested in their own reindeer herding district)
 - Selected layers
 - More detailed base layer, possibility to change them in the map view
 - Layer names
 - Color codes that are in the timeline could also be in the calendar
- Possibility to use selected CryoLand products in the Internet application "Liiteri" (WMS)?
